

1 C Introduction

C is syntactically very similar to Java, but there are a few key differences of which to be wary:

- C is function oriented, not object oriented, so there are no objects.
- C does not automatically handle memory for you.
 - In the case of stack memory (things allocated in the “usual” way), a datum is garbage immediately after the function in which it was defined returns.
 - In the case of heap memory (things allocated with `malloc` and friends), data is freed only when the programmer explicitly frees it.
 - In any case, allocated memory always holds garbage until it is initialized.
- C uses pointers explicitly. `*p` tells us to use the value that `p` points to, rather than the value of `p`, and `&x` gives the address of `x` rather than the value of `x`. See the following example (the following addresses were chosen arbitrarily). On the left we see a diagram of pointers and memory that may help you visualize pointers. On the right, we see how those “boxes and arrows” are really represented.

Let’s assume that `int* p` is located at `0xF9320904` and `int x` is located at `0xF93209B0`. As we can observe:

- `*p` should return `0x2A` (42_{10}).
- `p` should return `0xF93209AC`.
- `x` should return `0x61C`.
- `&x` should return `0xF93209B0`.

Let’s say we have an `int **pp` that is located at `0xF9320900`. What would `pp` return? How about `*pp`? What about `**pp`?

There are other differences in C of which you should be aware of, but this should be enough for you to get your feet wet.

2 Uncommented Code? Yuck!

The following functions work correctly (note: this does not mean intelligently), but have no comments. Document the code to prevent it from causing further confusion.

```

1. /*
   *
   */
int foo(int *arr, size_t n) {
    return n ? arr[0] + foo(arr + 1, n - 1) : 0;
}

2. /*
   *
   */
int bar(int *arr, size_t n) {
    int sum = 0, i;

    for (i = n; i > 0; i--) {
        sum += !arr[i - 1];
    }

    return ~sum + 1;
}

3. /*
   *
   */
void baz(int x, int y) {
    x = x ^ y;
    y = x ^ y;
    x = x ^ y;
}

```

3 Programming with Pointers

Implement the following functions so that they perform as described in the comments.

1. /* Swaps the value of two ints outside of this function. */

2. /* Increments the value of an int outside of this function by one. */

3. /* Returns the number of bytes in a string. Does not use strlen. */

4 Problem?

The following code segments may contain logic and syntax errors. Find and correct them.

1. `/* Returns the sum of all the elements in SUMMANDS. */`
`int sum(int* summands) {`
 `int sum = 0;`
 `for (int i = 0; i < sizeof(summands); i++)`
 `sum += *(summands + i);`
 `return sum;`
`}`
2. `/* Increments all the letters in the string STRING, held in an array of length N.`
 `* Does not modify any other memory which has been previously allocated. */`
`void increment(char* string, int n) {`
 `for (int i = 0; i < n; i++)`
 `*(string + i)++;`
`}`
3. `/* Copies the string SRC to DST. */`
`void copy(char* src, char* dst) {`
 `while (*dst++ = *src++);`
`}`
4. `/* Overwrites an inputted string with “61C is awesome!” if there’s room.`
 `* Does nothing if there is not. Assume that srcLength correctly represents`
 `* the length of src. */`
`void CS61C(char* src, size_t srcLength) {`
 `char *srcptr, replaceptr;`
 `char replacement[16] = “61C is awesome!”;`
 `srcptr = src;`
 `replaceptr = replacement;`
 `if (srcLength >= 16) {`
 `for (int i = 0; i < 16; i++)`
 `*srcptr++ = *replaceptr++;`
 `}`
`}`
